1 April 2019.

To Whom It May Concern:

Pro-Dosa BOOST is an oral paste comprised only of pure, nutritional elements, including vitamins, minerals, and amino acids, in doses reflective of the requirements for a 400-500kg horse in hard work as established by NRC and other researchers. Pro-Dosa BOOST contains no banned substances under FEI rules or under those in any racing jurisdiction, to the best of our knowledge. It is important, however, that horsemen consider any rules of competition that apply to them before using Pro-Dosa BOOST according to label directions.

Pro-Dosa BOOST is manufactured in a New Zealand Government, Ministry of Primary Industries inspected and approved GMP facility following a comprehensive quality management program to ensure the reliability, security, and quality of the finished product.

Raw ingredients used in the making of premixes are sourced from carefully selected suppliers with established quality management programs in place. Materials are of the highest standards we can source, and the vitamins, mineral, and amino acids are all highly refined chemicals that conform to the EP and USP for purity. (They are specified to be highly purified, human pharmaceutical grade materials.) These specifications minimize the chances raw ingredients will be contaminated before receipt at Pro-Dosa. Quantitative analysis, culture, and other appropriate tests are conducted on raw materials to demonstrate that they meet Pro-Dosa's strict specifications.

All finished product is submitted for culture and quantitative analysis prior to release, and all batches are submitted for analysis for naturally occurring prohibited substances. Laboratories contracted to do analyses are accredited.

Numerous in vivo clearance tests have been conducted at the New Zealand racing laboratory and at racecourses throughout Asia. In all cases, Pro-Dosa BOOST has been found to safe and reliable to use.

For more than 15 years, Pro-Dosa BOOST has been used in FEI competition, during FEI endurance races, and in racehorses in more than 30 countries. Pro-Dosa BOOST has never been implicated in a positive test.

Sincerely,

Corinne Hills, DVM
